BROCHURE

Factory software that fails safe.

Visual inspection, machine data and quality apps on one on-premise platform. If a camera, a check or the software fails, the part is rejected, never quietly passed.

Manual inspection drifts

People get tired, standards vary between shifts, and nothing records why a part was passed.

Vision projects are fragile

Every change needs the original integrator, and a fault can quietly pass parts that should have been rejected.

Machine data stays in the PLC

Counts, states and alarms stay on the machine, so OEE and quality reports are built by hand.

FAIL-CLOSED BY DESIGN

Never pass a part because the system was broken

A part is OK only when every expected view reports OK. Errors, timeouts and missing views all mean NG (rejected), and the result is written down before the PLC hears it.

01
Trigger
The PLC signals a part. Line safety is checked on every trigger.

02
Capture every view
Each camera runs the checks in the signed program.

03
A view faults
A camera times out. A missing result counts as a failed one.

04
Write the journal
Verdict and reason are recorded first.

05
NG to the PLC
Only then does the PLC get the result.

WHY GORAD

Compared with a smart camera or a custom project

- Multi-camera stations with one verdict per part
- Signed, versioned programs, changed from the browser without the original integrator
- Classical and AI checks in one program
- Inspection results feed SPC, NCR/CAPA and OEE on the same platform
- Air-gapped updates by USB, from the web interface

Who builds it

Gokulramesh Dhanasekar, founder, has built and deployed more than 30 production vision inspection systems in aerospace, automotive and heavy engineering.

Gorad Pvt Ltd · based in Bengaluru, India · serving plants worldwide

ONE PLATFORM

Start with one app. Grow without replacing anything.

Gorad Vision
Fail-closed visual inspection with a PLC handshake, signed programs, and classical and AI tools in one program.

Gorad Connect
Reads PLCs and meters over Modbus TCP, Siemens S7 and OPC UA, and keeps every event through network drops.

Platform Core
One login, roles, offline licensing, plant structure, audit trail, updates and backup.

Quality
SPC · NCR / CAPA · Calibration & MSA

Production
Line Performance (OEE, Andon) · Maintenance · Tool & Fixture Life

Compliance & logistics
Traceability · Label & Dispatch · Skills & Training

All apps are in early access: built and tested in software, and being proven with pilot plants.

WHAT IT IS BUILT TO INSPECT

Connecting rods
Chip-off, voids, dents, burrs and machining defects on every face.

Catalyst blockage
Blocked-cell percentage against your threshold.

PCB assembly
Component presence, location and polarity.

IGBT module variants
The right variant for the batch, from markings and features.

Bearing pin count
Every pin counted, a missing one marked.

Brick damage
Cracks, chipped edges and broken corners on a moving line.

BUILT FOR PLANTS

- On-premise: Ubuntu appliance, VM or your RHEL server
- Air-gap ready: offline licence, USB release, updates from the UI
- Signed programs, server-side roles, append-only audit trail
- PLCs: Modbus TCP, Siemens S7, OPC UA
- Cameras: GenICam / GigE Vision and USB

PILOT PROGRAMME

01 **Qualify** — Is Gorad the right fit?

02 **Samples** — Proof on your parts.

03 **One station** — Installed with your team.

04 **Decide** — With the evidence.
